

A. Minimum Detectable Effect by Test-Retest Precision

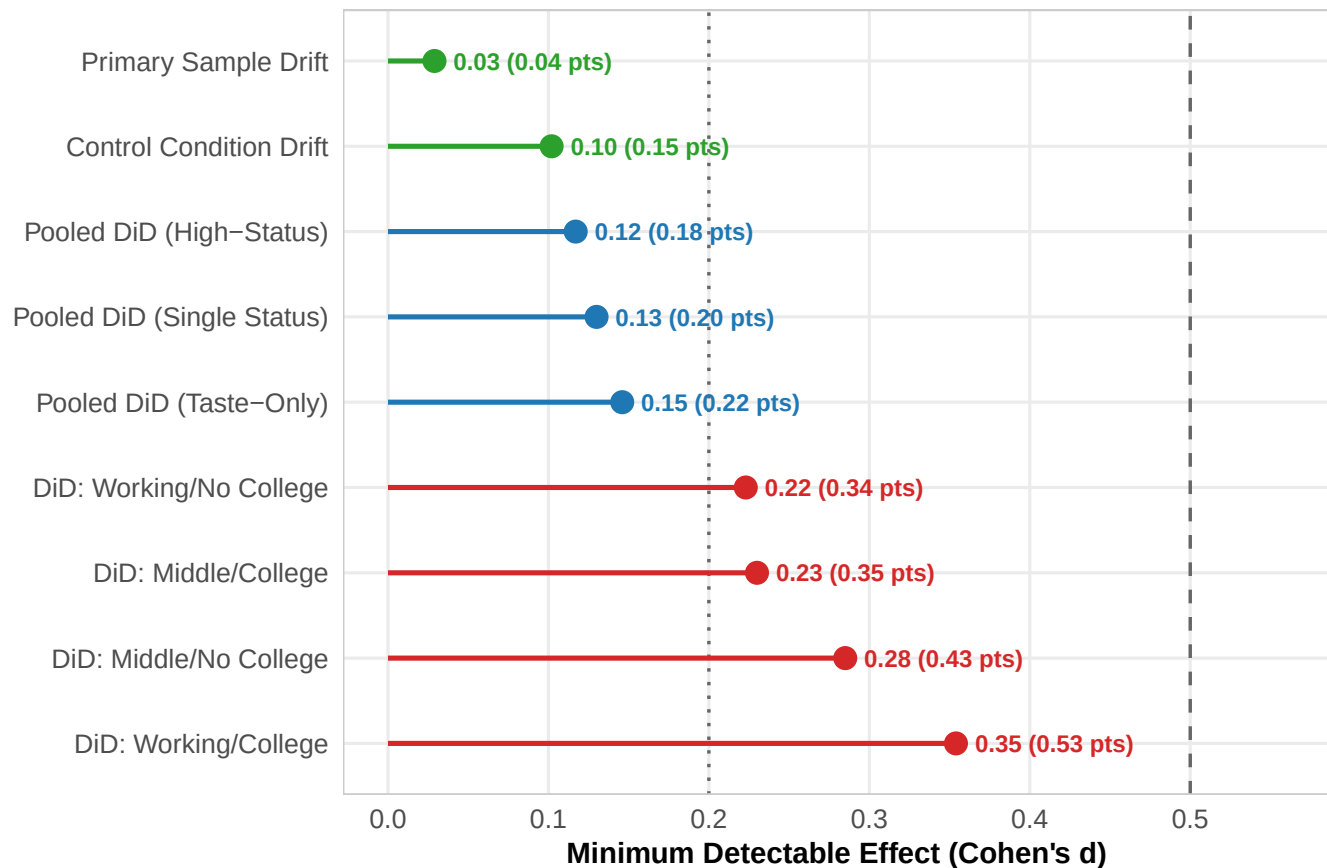

Power = 0.80, $\alpha = 0.05$; comparing post-only vs. repeated-measures DiD

- $r = 0.00$ (Independent Post-Test)
- $r = 0.50$ (Moderate Autocorrelation)
- $r = 0.70$ (Standard Repeated Measures)
- $r = 0.89$ (Empirical Study Precision)

B. Empirical MDE Achieved in This Study (Power = 0.80)

Standardized Cohen's d (and 7-point scale raw units) at $\alpha = 0.05$

- Drift
- Pooled DiD
- Subgroup DiD
